

Using large telescopes to answer: why must the Sun have a chromosphere and corona?

Philip Judge, Roberto Casini (*NCAR-HAO*)

Session: SpS6 Science with large solar telescopes

Type of presentation: Oral

I will discuss the potential for ground-based telescopes such as the ATST to make breakthrough discoveries about the long standing mysteries of the solar chromosphere and corona. The biggest advances will hinge upon the ability to diagnose magnetic fields through high s/n spectropolarimetry.
